Surgeon General

January 6, 1968

Chief, Communicable Disease Center

Tuskegee Syphilis Study

The winter of 1957-58 makes the 25th year since the initiation of the study of untreated syphilis in the male Negro at Tuskegee, Alabama. An intensive round-up of these patients is just beginning and it is hoped that this 25th year survey will be one of the most successful yet conducted.

As an incentive to stimulate full participation by the patients, it has been suggested that the attached certificate with your signature be presented to each patient on completion of the examination in recognition of his contribution to medical research.

We would greatly appreciate it if you would sign the attached and return same to this office at your earliest convenience.
